

High risk

Several essentials are not covered. Your site is an easy target for automated attacks.

Your answers: 30/100 · Technical checks: 60/100

Technical checks of your site

4 of 10 checks passed. Non-intrusive: home page and public DNS only.

HTTPS certificate & encryption

Valid certificate (64 days left), TLSv1.3.

Passed

Automatic redirect to HTTPS

HTTP visitors are redirected to HTTPS.

Passed

HTTPS enforced in browsers (HSTS)

Missing: an attacker on the network can force an unencrypted connection.

Failed

Content Security Policy (CSP)

Missing: the site is less protected against malicious script injection (XSS).

To improve

Clickjacking protection

Missing: the site can be embedded in a trap page.

To improve

MIME-sniffing protection

Enabled.

Passed

Outgoing links privacy

Not defined: internal URLs may leak to other sites.

To improve

Exposed technical information

Software version visible ("Apache/2.4.41 · PHP/7.4.3"): makes known flaws easier to target.

To improve

Domain e-mail protection (SPF)

SPF record present.

Passed

E-mail spoofing protection (DMARC)

Missing: e-mails spoofing your domain are not blocked.

Failed

Your points of attention

1 No plan if a flaw is found

Write one page: who to call, how to take the site offline, how to inform customers.

2 No one owns the updates

Name an owner (in-house or provider) and an update schedule, in writing.

3 Security not checked recently

Have your site tested at least once a year, and after every major change.

Go further

Move on to a full security assessment

These checks only see the visible surface of your site. Real vulnerabilities (code, logins, back office, server) need an expert eye. Our experts deliver:

- a vulnerability audit of your website or application;
- a penetration test;
- a detailed report with a prioritised remediation plan.

Quoted service. Book a meeting to scope your needs and receive a tailored proposal.
